OPEN CITY

Openness is at the center of current societal debates when issues of belonging, security and resource distribution are being negotiated. In the light of insecurity and uncertainty regarding future developments, current societal debates point towards new lines of conflict regarding „openness“ and „closure“ within urban areas. Openness has interlinked dimensions: the physical openness of space, institutional openness, the openness of social, economic and ecological systems, and responsiveness to future change.

The *open city* is a challenging concept and an opportunity. The exploration of such new perspectives and approaches considering openness in urban development is crucial as the speed of societal changes, urban growth and deteriorating environmental conditions increases. Can the concept of openness provide designers, planners, decision makers and citizens new strategies to counter multiple uncertainties in the process of urban development, without irrevocably obstructing future possibilities?
